Vodacom Nigeria trains students about IoT

Thursday 22 March 2018 | 15:18 CET | News

Vodacom Business Nigeria has organised a robotics training session for 36 young students from the SS Peter & Paul Nursery and Primary School in order to further technological development in the education sector and among the next generation.

The young students, aged 8-10, through a practical course on robotics, were given the opportunity to learn about the integration of the Internet of things (IoT) in robotics and its growing relevance in various areas of modern life. The students were taught how to build, programme and control robots, drones and other artificial intelligence. This demonstrated the essential nature of technology in various aspects of everyday life, including securing lives and property. As a practical demonstration of this, students were shown how drones could be used for a wide range of services in today's world. This includes the delivery of medication and lifesaving supplies to remote locations in emergency situations, which is already happening in some locations around the world.

They were also given a tour of the company's facilities, exposing them to the importance of connectivity and telecommunications technology in today's digital world. Vodacom Business Nigeria constantly uses industrial tours and field trips to educate students from primary, secondary and tertiary schools on new telecommunications technologies that are driving the economy.
